Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster and melanogaster and provided by Razutoyo Oscegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Cantitute in Buffalo, NY. The library is named RPCI-99 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: on bw sp, the same strain used for the BDGP's pl and bow to order individual BAC clones, the entire library and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be load/drosophila_Dac.htm.

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC ibrary was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RRCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitiy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2. cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GSS 25-MAY-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LMAJFV1_lm44f10.x1 Leishmania major FV1 random genomic library Leishmania major genomic clone LMAJFV1_lm44f10 3' similar to contains element V1-ch1_type_II.2 leishmania repetitive element

//note="Wedcror: pBaCIndigo; Site_1: EcoRI; Site_2: EcoRI;
Rice is the most important food crop in the world. Half of
the world population, especially those inhabiting highly
populated areas of the humid tropics and subtropics, rely
on rice as their primary source of carbohydrate.
Monocotyledonous rice is a diploid plant (2n=24) with a
haploid genome equivalent of 431 Mbp (Arumuganathan and
Earle, 1991). The relatively small genome of rice, three
times larger than that of Arabidopsis, makes it suitable
for genomic studies. In order to facilitate positional
cloning, physical mapping and genome sequencing of rice,
we have constructed a BAC library from Oryza sativa,
Nipponbare variety using EcoRI as the cloning enzyme. The
library contains 55,296 clones with an average insert size
of 121 Kb providing approximatley 15 haploid genome
equivalents. The deep coverage allows the isolation a
particular sequence with a probability of 99.9 %. Three
high density filters, each containing 18,432 clones
(doubly spotted), represent the whole library for colony
screening and can be requested from the Clemson University
BAC/EST Resource Center (www.genome.clemson.edu)."

/note="Vector: pZero-2 (Invitrogen); Site_1: EcoRV;
Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size distribution of 1-1.5kb fragments, blunt-ended with T4 DNA polymerase, dephosphorylated with Shrimp Alkaline
Phosphatase and ligated into pZero-2 vector's EcoRV site."

LMAA_FVL_Im43e03.x1 Leishmania major FV1 random genomic library
Leishmania major genomic clone LMAA_FV1_lm43e03 3' similar to
contains element V1-chl_type_II.5 V1-chl_type_I leishmania
repetitive element ;, DNA sequence.

/note="Vector: pZero-2 (Invitrogen); Site_1: ECORV;
Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size
distribution of 1-1.5kb fragments, blunt-ended with T4 DNA
polymerase, dephosphorylated with Shrimp Alkaline
Phosphatase and ligated into pZero-2 vector's ECORV site."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Submitted (13-37L-1999) Genoscope - Centre National de Sequencage : BP 191 91006 EVRY cedex - FRANCE (E-mail : seqrefégenoscope.cns.fr - Web : www.genoscope.cns.fr)

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC - Intrary (Dros BAC) was made by Alain Bliland at CEPH (Centre d'Etude du Dyymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If the cannot be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.

Cosmid Oll Cosmid Oll lies between H24 and D78 on the Asel-Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous.

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Blibb et al., Gene 30:157-66(1984) as implemented at

SW.CYSA_STRCO (EMBL: U37580), CySA, S. COCLICOLOR putchive Cystathionine gamma-lyase (392 aa). Similar to many e.g. SW.MEGL_PSEPU (EMBL: U98854), mdeh. Pseudomonas putlda methionine gamma-lyase (398 aa), fasta scores; opt: 608 z-score: 653 6 E(): 4.5e-29, 36,9% identity in 404 aa overlap. Highly similar to TR: 053668 (EMBL: X9139) Streptomyces antibloticus hypothetical protein found upstream of the abaB gene (232 aa) (87.1% identity in 232 aa overlap). Contains Pfam match to PF01653 and overlap. Sy.Met metabolism Plr-dependent enzyme and PS00868 Cys/Met metabolism enzymes pyridoxal-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein-tyrosine-phosphatase, len: 164 aa; previously sequenced as SW:PTPA_STRCO (EMBL:U3/580), ptpA, scoulcolor low molecular weight. contains Pfam match protein-tyrosine-phosphatase (164 aa). Contains Pfam match to PP01451 LMWPc, Low molecular weight phosphotyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /translation="MYKRVCFVCTGNICRSPMAEAVFRRNEDAGLGHLVEADSAGTG GWHEGEGADPRTEAVLADHGYGLDHARQFQGSWFSRLDLVVALDAGHLRALRRLAPT BRDAAKVRLLRSYDPAVAGGDLDVPDPYYGGRDGFEECLEMVEAASTGLLAAVREQVE GRAA"

/gene="SCQ11.02c" abaB, probable lysR-family
/note="SCQ11.02c, abaB, probable lysR-family
transcriptional regulator, len: 301 aa; previously
sequenced as TR:Q53869 (EMBL:U37580) s.coelicolor
lysR-like procein (301 aa). Highly similar to
SW:ARAB_STRAT (EMBL:X91393), araB, Streptomyces
antibioticus transcriptional regulatory protein (301 aa),
fasta scores; opt: 1581 z-score: 1813.2 E(;; 0, 80.3%
identity in 300 aa overlap. Similar to many other
transcriptional regulators. Contains probable
helix-turn-helix motif at aa 17-38 (Score 1659, +4.84 SD).
Contains Pfam match to PF00126 HTH., Bacterial regulatory
helix-turn-helix protein, lysR family and PS00044
Bacterial regulatory proteins, lysR family signature"

BASE COUNT ORIGIN

where these have been used to deduce the initiation codon. Gane prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4766-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/ jun/cgi.bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg., gtg., trg or (att.)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cennot be identified we choose the most upstream initiation codon. IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. If may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid BigA lies between and overlaps cosmids E6 and E56 on the Asole genomic restriction fragment. Location/Qualifiers source //strain=*A3(2)"	/db.zrei="ftaxon:100226" /db.zrei="ftaxon:100226" /gene="SCE19A.01" /gene="SCE19A.02" /gene="SCE19A.03" /gene="SCE19A.03	/protein_id="CAB50983.1" //db_xxef="Gl:5531351" //db_xxef="Gl:5531351" //db_xxef="Gl:5531351" //db_xxef="Gl:5531351" //db_xxef="Gl:5531351" //db_xxef="Gl:5831351" //db_xxef="Gl:5831351" //db_xxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //db_yxef="Gl:5831351" //dre="SCE194.03c" //dr

AL0	Details of S. coelicolor sequencing at the Sanger Centre are available on the World Wide Web. (URL: http://www.sanger.ac.uk/Projects/S_coelicolor/) CDS are numbered using the following system eg SC7B7.01c. SC (S. coelicolor), 7B7 (cosmid name), .01 (first CDS), c (complementary strand). The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS. Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given
